- ▶ it is also a big success story in NLP
 - ▶ robust and efficient
 - ▶ high accuracy across domains and languages
 - ▶ enables cross-lingual approaches
- ▶ and it is *simple*

The simplicity

He walks and talks .

The simplicity

He walks and talks .

A red line diagram is drawn below the text. It starts at the word 'talks', goes down, then left along a horizontal line, then up, and finally left to an arrowhead pointing at the word 'He'. This diagram likely represents a return path or a loop in a state transition model.

The simplicity

The simplicity

The simplicity

With great speed and accuracy, come great constraints.

- ▶ tree constraints
 - ▶ single root, single head
 - ▶ spanning, connectedness, acyclicity
 - ▶ sometimes even projectivity
- ▶ there's been a lot of work beyond that
 - ▶ plenty of lexical resources
 - ▶ successful semantic role labeling shared tasks
 - ▶ algorithms for DAG parsing
- ▶ but?
 - ▶ it's apparently *balkanized*, i.e.,
the representations are not as uniform as in deparsing

Recent efforts

- ▶ Banarescu et al. (2013):

We hope that a sembank of simple, whole-sentence semantic structures will spur new work in statistical natural language understanding and generation, like the Penn Treebank encouraged work on statistical parsing.

- ▶ Oepen et al. (2014):

SemEval semantic dependency parsing (SDP) shared task

- ▶ WSJ PTB text
- ▶ three DAG annotation layers: DM, PAS, PCEDT
- ▶ bilexical dependencies between words
- ▶ disconnected nodes allowed

SDP 2014 shared task

(b) DELPH-IN Minimal Recursion Semantics-derived bi-lexical dependencies (DM).

(c) Enju Predicate–Argument Structures (PAS).

(d) Parts of the tectogrammatical layer of the Prague Czech-English Dependency Treebank (PCEDT).

SDP 2014 shared task

	DM	PAS	PCEDT
(1) # labels	51	42	68
(2) % singletons	22.62	4.49	35.79
(3) # edge density	0.96	1.02	0.99
(4) %_g trees	2.35	1.30	56.58
(5) %_g projective	3.05	1.71	53.29
(6) %_g fragmented	6.71	0.23	0.56
(7) %_{ri} reentrancies	27.35	29.40	9.27
(8) %_g topless	0.28	0.02	0.00
(9) # top nodes	0.9972	0.9998	1.1237
(10) %_{ri} non-top roots	44.71	55.92	4.36

	Directed			Undirected		
	DM	PAS	PCEDT	DM	PAS	PCEDT
DM	—	.6425	.2612	—	.6719	.5675
PAS	.6688	—	.2963	.6993	—	.5490
PCEDT	.2636	.2963	—	.5743	.5630	—

- ▶ uniform, but not the same
- ▶ PCEDT seems to be somewhat more distinct
- ▶ key ingredients of non-trees
 - ▶ singletons
 - ▶ reentrancies: $\text{indegree} > 1$

Parsing with tree approximations

Team	Track	Approach	Resources
Linköping	C	extension of Eisner's algorithm for DAGs, edge-factored structured perceptron	—
Potsdam	C & O	<u>graph-to-tree transformation</u> , Mate	companion
Priberam	C & O	model with second-order features, decoding with dual decomposition, MIRA	companion
Turku	O	cascade of SVM classifiers (dependency recognition, label classification, top recognition)	companion, syntactic n-grams, word2vec
Alpage	C & O	transition-based parsing for DAGs, logistic regression, structured perceptron	companion, Brown clusters
Peking	C	transition-based parsing for DAGs, <u>graph-to-tree transformation</u> , parser ensemble	—
CMU	O	edge classification by logistic regression, edge-factored structured SVM	companion
Copenhagen-Malmö	C	<u>graph-to-tree transformation</u> , Mate	—
In-House	O	existing parsers developed by the organizers	grammars

*Hey, these DAGs are very tree-like.
Let's convert them to trees and use standard deparsers!*

Parsing with tree approximations

GOLD STANDARD

LOCAL

DFS

Parsing with tree approximations

- ▶ flip the flippable, baseline-delete the rest
- ▶ train on trees, parse for trees, flip back in post-processing

Parsing with tree approximations

- ▶ flip the flippable, baseline-delete the rest
- ▶ train on trees, parse for trees, flip back in post-processing
- ▶ works OK...ish
 - ▶ average labeled F_1 in the high 70s
 - ▶ task winner votes between tree approximations

Where do all the lost edges go?

- ▶ the deleted edges cannot be recovered
- ▶ upper bound recall
 - ▶ graph-tree-graph conversion with no parsing in-between
 - ▶ measure the lossiness

	DM				PCEDT

LOCAL	100.00	87.50	17.35	79	100.00	92.33	54.65	124
DFS	100.00	97.30	65.43	79	100.00	94.03	54.58	133

- ▶ new agenda
 - ▶ inspect the lost edges
 - ▶ build a better tree approximation on top

Where do all the lost edges go?

Where do all the lost edges go?

- ▶ there are *undirected* cycles in the graphs
 - ▶ interesting structural properties?
 - ▶ discriminate specific phenomena they encode?

Undirected cycles

- ▶ we mostly ignore PAS from now on
- ▶ DM: 3-word cycles dominate (*triangles*)
- ▶ PCEDT: 4-word cycles (*squares*)
- ▶ sentences with more than one cycle not very frequent

Undirected cycles

- ▶ DM, PAS: mostly control and coordination
- ▶ PCEDT: almost exclusively coordination
- ▶ supported also by the edge label tuples, and the lemmas

Back to tree approximations

- ▶ edge operations up to now
 - ▶ *flipping* – comes with implicit *overloading*
 - ▶ *deletion* – edges are permanently lost

Back to tree approximations

- ▶ edge operations up to now
 - ▶ *flipping* – comes with implicit *overloading*
 - ▶ *deletion* – edges are permanently lost
- ▶ new proposal
 - ▶ detect an undirected cycle
 - ▶ select and disconnect an appropriate edge
 - ▶ *radical*: overload an appropriate label for reconstruction, or
 - ▶ *conservative*: trim only a subset of edges using lemma-POS cues
 - ▶ in post-processing, reconnect the edge
 - ▶ by reading the reconstruction off of the overloaded label, or
 - ▶ by detecting the lemma-POS trigger
- ▶ we call these operations *trimming* and *untrimming*

Trimming and untrimming

— original — flipped — trimmed — overloaded

Upper bounds

Parsing

- ▶ preprocessing: trimming + DFS + baseline = training trees
- ▶ training and parsing
 - ▶ `mate-tools` graph-based deparser
 - ▶ CRF++ for top node detection
 - ▶ SDP companion data and Brown clusters as additional features
- ▶ postprocessing: removing baseline artifacts + reflipping +
+ untrimming = output graphs

- ▶ lower upper bounds, higher parsing scores
- ▶ nice increase in *LM*
- ▶ best overall score for any tree approximation-based system

Conclusions

- ▶ our contributions
 - ▶ put SDP DAGs under the lens
 - ▶ uncovered the link between non-trees and control, coordination
 - ▶ used this to implement a state-of-the-art system based on tree approximations
- ▶ future work
 - ▶ did some more experiments
 - ▶ answer set programming for better tree approximations
 - ▶ did not see improvements
 - ▶ go for *real* graph parsing

Thank you for your attention. 😊
